## HOW TO REPLY TO THIS NOTICE:

I. Review the SMALL ENTITY status shown above.

If the SMALL ENTITY is shown as YES, verify your current SMALL ENTITY status:

A. If the status is the same, pay the TOTAL FEE(S) DUE shown above.

B. If the status above is to be removed, check box 5b on Part B - Fee(s) Transmittal and pay the PUBLICATION FEE (if required) and twice the amount of the ISSUE FEE shown above, or

## DETAILED ACTION

### *Allowable Subject Matter*

1. Claims 1-22 are allowed.
2. The following is an examiner's statement of reasons for allowance: each of the combinations of limitations in independent claims 1, 15, and 22 requires the compound to be non-covalently bound to the hydrophobin-like substance. Applicants have found that "[t]his mode of binding leaves the secondary and tertiary structure of such biological compounds virtually intact and, thus, allows improved biological recognition as compared to covalent binding methods which often alter such structural determinants." See the paragraph [0028] of the specification.

In the International Preliminary Examination Report for International application No. PCT/NL02/00411 claims 1-22 were recognized as being novel, but not inventive over references "D1-D6" as identified therein. The Examiner of the instant application disagrees with the European examiner's argument as to why the claimed invention is not inventive. The European examiner states that it was well known to coat a sensor surface with bilayer lipid membranes, as shown by references D1 and D2, for example. Next the European examiner states that reference D6 shows that it was known to use

Art Unit: 1795

self-assembled monolayers of proteins to immobilize biologically functional macromolecules on biosensors either covalently or non-covalently. The European examiner then states it was known that hydrophobins form self-assembling, amphipatic films which are suitable for attaching molecules thereby to the surfaces as shown by references D3, D4, and D5. From these statements the European examiner concludes that the substitution of hydrophobins for a lipid bilayer in a sensor is not inventive.

Reference D6, however, makes not mention sensors. The disclosed uses of the self-assembled monolayers of proteins are for nanoelectronics or nonlinear optics, such as transistors or quantum-dot lasers. See the abstract and "Conclusion and perspectives" on page 11. Moreover, reference D6 does not mention hydrophobins, but discusses bacterial S-layer proteins, which are "... composed of a single protein or glycoprotein species, with molecular weights from 40 to 200kDa. The crystalline arrays exhibit either oblique, square or hexagonal lattice symmetry ... " See the first paragraph of "Characteristics of S-layers". In contrast, "[h]ydrophobins are small proteins (100±25 amino acids) that are moderately hydrophobic ...have a conserved spacing of eight cysteine residues: X<sub>2-38</sub>-C-X<sub>5-9</sub>-C-C-X<sub>11-39</sub>-C-X<sub>8-23</sub>-C-X<sub>5-9</sub>-C-C-X<sub>6-18</sub>-C-X<sub>2-13</sub> in which X signifies any other amino acid ... " See in reference D3 item 1 on page 6 and item 3 on page 8. Thus, S-layer proteins are defined differently than hydrophobins and do not suggest hydrophobins or properties that hydrophobins may have.

Reference D3 does actually disclose coating at least a part of a surface of a sensor with a hydrophobin-like substance and contacting the hydrophobin-like substance with a compound to form a bond between the hydrophobin-like substance

and the compound. However, the bond formed between the compound and the hydrophobin-like substance is a covalent bond resulting from oxidizing mannose residues with periodic acid and coupling the generated aldehyde groups to amino acid groups of a protein by a Schiff-base reaction. See item 2 on page 35 of reference D3.

As for references D4 and D5, reference D4 does not mention sensors and so does not mention coating a sensor surface with hydrophobin and also does not mention bonding a compound to a hydrophobin coating. Reference D5 only mentions that hydrophobins could be used as a coating in medical devices, such as catheters, and that "[a]ttachment [of molecules] could be achieved by chemical cross-linking after the hydrophobin has been assembled on the surface [of the medical device]." See the second column on page 3.

Thus, the examiner of the instant application does not agree with the European examiner that hydrophobin is an obvious alternative to lipid bilayers as a sensor surface coating

De Vocht et al. US 2003/0134042 A1 was not cited by the European examiner. It is relevant because it discloses coating a biosensor with hydrophobin. However, the disclosure is very broad in that "biosensor" is only in a list of objects that may be coated including other objects such as a window, a contact lens, a medical device, a container for performing an assay or storage, the hull of a vessel or a frame or bodywork of a car, and a solid particle. See paragraphs [0002] and [0005]. Also, de Vocht does not mention non-covalently attaching a compound to a hydrophobin.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
